

Chapter 4

Processor Organization

Thoai Nam

Faculty of Computer Science and Engineering

HCMC University of Technology

Outline

- ❑ Criteria:

- Diameter, bisection width, etc.

- ❑ Processor Organizations:

- Mesh, binary tree, hypertree, pyramid, butterfly, hypercube, shuffle-exchange

Criteria

❑ Diameter

- The largest distance between two nodes
- Lower diameter is better

❑ Bisection width

The minimum number of edges that must be removed in order to divide the network into two halves (within one)

❑ Number of edges per node

❑ Maximum edge length

- ❑ Q-dimensional lattice
- ❑ Communication is allowed only between neighboring nodes. **Interior nodes** communicate with $2q$ other nodes.

Mesh (2)

- Q-dimensional mesh with k^q nodes
 - Diameter: $q(k-1)$
 - Bisection width: k^{q-1}
 - The maximum number of edges per node: $2q$
 - The maximum edge length is a constant

Binary Tree

- Depth $k-1$: 2^k-1 nodes
- Diameter: $2(k-1)$
- Bisection width: 1
- Length of the longest edge: increasing

□ Bandwidth problem on binary tree

Hypertree (1)

- Hypertree of degree k and depth d : a complete k -ary tree of height d .

Hypertree (2)

- A 4-ary hypertree with depth d has 4^d leaves and $2^d(2^{d+1}-1)$ nodes in all
 - Diameter: $2d$
 - Bisection width: 2^{d+1}
 - The number of edges per node ≤ 6
 - Length of the longest edge: increasing

- ❑ Size k^2 : base a 2D mesh network containing k^2 processors, the total number of processors = $(\frac{4}{3})k^2 - \frac{1}{3}$
- ❑ A pyramid of size k^2 :
 - Diameter: $2\log k$
 - Bisection width: $2k$
 - Maximum of links per node: 9
 - Length of the longest edge: increasing

Butterfly (1)

- ❑ $(k+1)2^k$ nodes divided into $k+1$ rows (rank), each contains $n=2^k$ nodes.
- ❑ Ranks are labeled 0 through k
- ❑ $\text{Node}(i,j)$: j -th node on the i -th rank
- ❑ $\text{Node}(i,j)$ is connected to two nodes on rank $i-1$: $\text{node}(i-1,j)$ and $\text{node}(i-1,m)$, where m is the integer found by inverting the i -th most significant bit in the binary representation of j
- ❑ If $\text{node}(i,j)$ is connected to $\text{node}(i-1,m)$, then $\text{node}(i,m)$ is connected to $\text{node}(i-1,j)$
- ❑ Diameter= $2k$
- ❑ Bisection width= 2^k
- ❑ Length of the longest edge: increasing

Butterfly (2)

Node(1,5): $i=1, j=5$

$j = 5 = \mathbf{101}$ (binary)

$\downarrow i=1$

$\mathbf{001} = 1$

Node(1,5) is connected to
node(0,1)

$i, j \rightarrow i-1, m$
 $i, m \rightarrow i-1, j$

Hypercube (1)

- ❑ 2^k nodes form a k -dimensional hypercube
- ❑ Nodes are labeled $0, 1, 2, \dots, 2^k-1$
- ❑ Two nodes are adjacent if their labels differ in exactly one bit position
- ❑ Diameter= k
- ❑ Bisection width= 2^{k-1}
- ❑ Number of edges per node is k
- ❑ Length of the longest edge: increasing

Hypercube (2)

Hypercube (3)

□ 5 = **0101**

□ 1 = **0001**

□ 4 = **0100**

□ 13 = **1101**
